KVM as a *hypervisor* complements the choice of Ubuntu - being a matched pair in terms of support, and also because of the significant degree of attention it garners from the OpenStack development community (including the authors, who mostly use KVM). It is also feature complete, free from licensing charges and restrictions.

Next, take a look at what Fixed IP networks are configured in your cloud.
 You can use the **nova** command-line client to get the IP ranges.

```
$ nova network-list
```

ID	Label	Cidr
3df67919-9600-4ea8-952e-2a7be6f70774	test01	10.1.0.0/24
8283efb2-e53d-46e1-a6bd-bb2bdef9cb9a	test02	10.1.1.0/24

The **nova-manage** tool can provide some additional details.

```
$ nova-manage network list
```

```
id IPv4      IPv6 start address DNS1 DNS2 VlanID project
uuid
1  10.1.0.0/24 None 10.1.0.3      None None 300      2725bbd

usage: cinder snapshot-create [--force <True|False>]
[--display-name <display-name>]
[--display-description <display-description>]
<volume-id>
Add a new snapshot.
Positional arguments:  <volume-id>          ID of the volume to snapshot
Optional arguments:  --force <True|False>  Optional flag to indicate whether to
snapshot a volume                               even if its attached to an instance.
(Default=False)  --display-name <display-name>  Optional
snapshot name. (Default=None)
--display-description <display-description>
Optional snapshot description. (Default=None)

##

```
Ubuntu 12.04#RabiitMQ#####2.7.1#55672#####
#####RabbitMQ#####3.0####15672#####Ubuntu#####
#####RabbitMQ#####
```

```
$ dpkg -s rabbitmq-server | grep "Version:"
Version: 2.7.1-0ubuntu4
```

An alternative to enabling the RabbitMQ Web Management Interface is to use the **rabbitmqctl** commands. For example, **rabbitmqctl list_queues | grep cinder** displays any messages left in the queue. If there are, it's a possible sign that cinder services didn't connect properly to rabbitmq and might have to be restarted.
